

File_delivery

This tool helps out while sorting the multiple file formats by file extension within a given output directory.

The screenshot shows the 'File_delivery' application window. It features a large Qlist widget on the left for multiple input paths, a Qline edit widget below it for output paths, a yellow 'Execute!!' button, and a red 'Clear!' button. A progress bar at the bottom shows 0% completion. Annotations with arrows point to these elements:

- This Qlist widget holds out multiple input paths.
- This Qline edit holds output paths.
- When you click on the Execute button, it runs the code.
- To clear the widget, click on the clear button.
- When you click on the Input button, it opens QFileDialog, where you can select the input folder path.
- To obtain the output path, click the output button.

To use these tools, you need to click on app.bat file
